

QUESTION:**Second Largest**

Given an array of **positive** integers **arr[]**, return the **second largest** element from the array. If the second largest element doesn't exist then return **-1**.

Note: The second largest element should not be equal to the largest element.

Examples:

Input: arr[] = [12, 35, 1, 10, 34, 1] **Output:** 34 **Explanation:** The largest element of the array is 35 and the second largest element is 34.

Input: arr[] = [10, 5, 10] **Output:** 5 **Explanation:** The largest element of the array is 10 and the second largest element is 5.

Input: arr[] = [10, 10, 10] **Output:** -1 **Explanation:** The largest element of the array is 10 and the second largest element does not exist.

Constraints:

$2 \leq \text{arr.size}() \leq 105$

$1 \leq \text{arr}[i] \leq 105$

Hint:

Think like finding the 1st maximum and storing it some where and now find maximum again but the 2nd maximum should be less than the first.

ANSWER:

```
class Solution {  
    public:
```

```
int getSecondLargest(vector<int> &arr) {  
    // code here  
    int max=-1, max2=-1;  
    for(auto i:arr){  
        if(i>max)  
            max=i;  
    }  
    for(auto i:arr){  
        if(i>max2 && i<max)  
            max2=i;  
    }  
    return max2;  
}  
};
```
